

DC-Line

The star among cruising sails

DIMENSION - POLYANT DC-line were developed to create low stretch, durable, easy to handle, furling, high tech cruising sails. These sophisticated styles are produced by laminating two layers of polyester taf-feta on both sides of a film-encapsulated low stretch scrim.

Unique for the DC-line is the two layers of film. By laminating with two layers of film, we not only have improved the stretch resistance, but also increased the bondage. The smoother appearance of the laminate also improves the chafe resistance.
